**Hiring Manager
Fortinet
Burnaby, BC**

Re: Senior Dev QA Specialist — Job ID 23591

Dear Hiring Manager,

I am writing to apply for the Senior Dev QA Specialist position at Fortinet. With more than seven years of experience in software and hardware quality engineering, I have led testing and automation across SaaS applications, REST APIs, embedded devices, firmware, and network-connected systems. The role's focus on test strategy, automation, technical troubleshooting, and close collaboration with developers strongly aligns with my background.

In my current role at Vecima Networks, I lead QA and automation efforts across web applications, APIs, hardware, firmware, Linux systems, and cloud and on-premises environments. One of my key initiatives was migrating our automation from Sahi to Playwright, reducing reliance on licensed tooling, improving maintainability, and making automated testing more accessible to QA, Development, and Customer Engineering teams.

I also developed web-based internal tools that automate hardware validation and support remote diagnostics. This work required me to investigate issues across multiple technical layers, convert manual engineering processes into maintainable tools, and work closely with developers to reproduce defects, isolate root causes, verify fixes, and assess release risk. My independent web and mobile projects have further strengthened my software development, API integration, testing, and product-thinking skills.

I would bring Fortinet a combination of senior QA experience, automation ownership, system-level troubleshooting, internal tool development, and cross-functional communication. I am particularly interested in contributing to a cloud-services development team where DevQA plays an active role in understanding features, customer scenarios, technical risks, and release quality. Thank you for considering my application.

Sincerely,
Current Zeng
